

Commercial Fishery - Prawn by Trap Supply 1980 to 2002 Haida Gwaii/Queen Charlotte Islands

This graph represents the commercial catch data used to derive the yearly catch maps. The **purple** blocks - UNDISCLOSED commercial catch supply - represent the total catch within all subareas where catch data was not provided due to DFO confidentiality guidelines. Above that, each block within a bar represents the annual catch from one DFO management subarea, ranked from highest to lowest catch. HIGH commercial supply areas (**red**) are the highest catch subareas that make up the first ~40% of the total annual catch for all subareas with catch information; MODERATE supply areas (**orange**) are the subareas that make up the next ~40% of total annual catch; and LOW supply areas (**yellow**) make up the final ~20% of catch. Note that blocks appearing to be black at the top of some bars are actually yellow subareas
